# Sharing & Visualizing Geographic Content through Geospatial Web Services (WMS,WFS – MapServer)

<u>Note:</u> The links (requests) may not work or be restricted to authorized users. Additional instructions are given in other resources of this module.

Emmanuel Stefanakis estef@unb.ca

# Example Scenario

- What are we going to implement?
  - Web Services to disseminate geographic content
- Where are we?
  - Heraklion, Crete Island, Greece
- What have we got?
  - Four Shapefiles
    - The four Prefectures in Crete (polygonal layer)
    - The Municipalities of Heraklion (polygonal layer)
    - The Towns of Heraklion (point layer)
    - The Highways of Heraklion (linear layer)

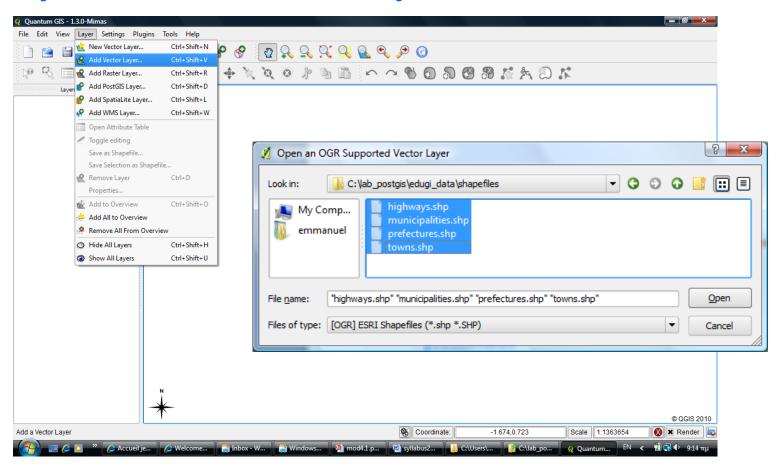

- In <a href="http://gaia.gge.unb.ca:8080/gge5403/labs/5/SHPService/shapefiles/">http://gaia.gge.unb.ca:8080/gge5403/labs/5/SHPService/shapefiles/</a>
  - there are four shapefiles

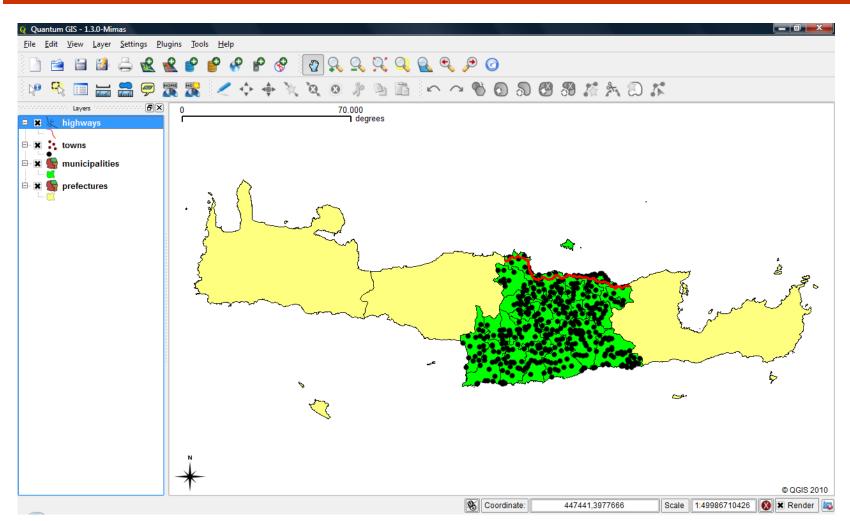

(needs a VPN connection)

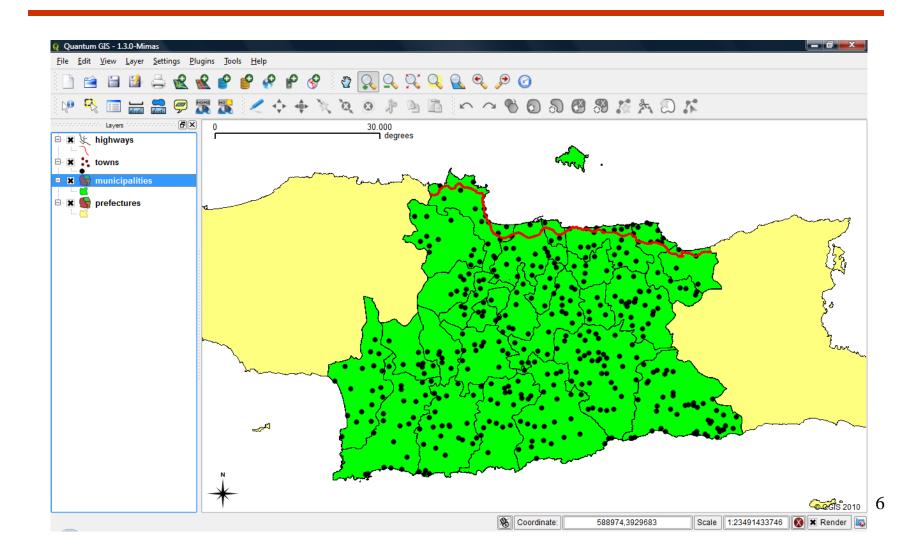

- prefectures
- municipalities
- highways
- towns

• Let's visualize them in Quantum GIS....

Layer > Add Vector Layer

- The dissemination of Geo-data can be made through Web Services
  - Two common OGC Services
    - WMS
    - WFS
  - WMS (vs) WFS
    - WMS returns a map image
    - **WFS** returns geographic **features** (geometries and thematic data) in GML format

# OGC Specifications for Web Services

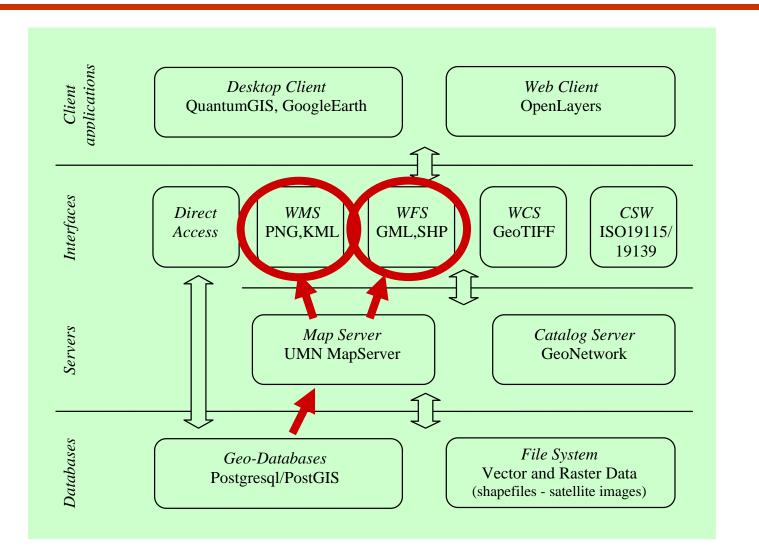

- Requests sent via URL...
  - Typical requests ...
    - GetCapabilities
      - What do you offer?
    - GetMap
      - Give me the map as an image
    - GetFeatures
      - Give me the map **features** (as objects; GML)
    - GetFeatureInfo
      - Give me the attribute values of a feature

We shall implement the two services

- Using UMN MapServer s/w
  - MapServer is an Open Source platform for publishing spatial data and interactive mapping applications on the web (<a href="http://mapserver.org/index.html">http://mapserver.org/index.html</a>)

- Available @UNB Server
  - <a href="http://gaia.gge.unb.ca:8080">http://gaia.gge.unb.ca:8080</a> (needs a VPN connection)

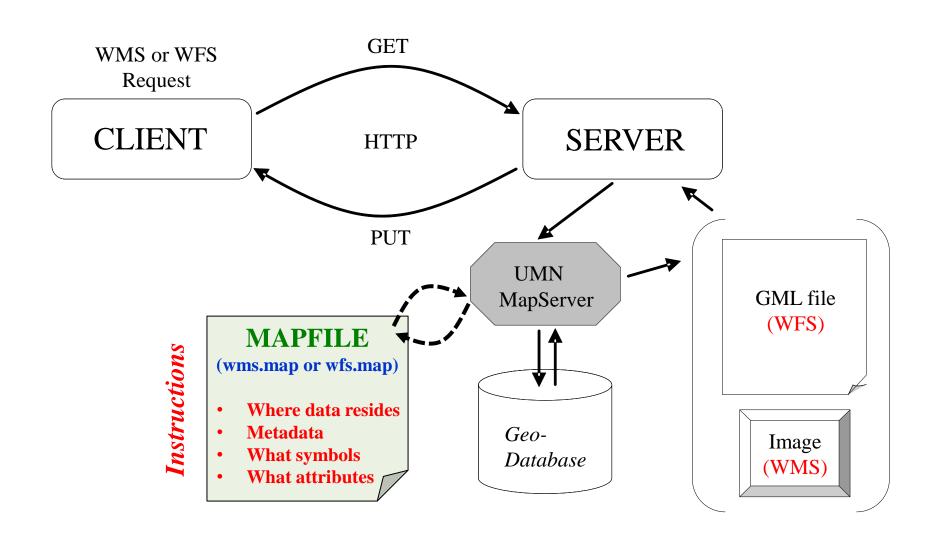

# (part of a more complex configuration The architectur

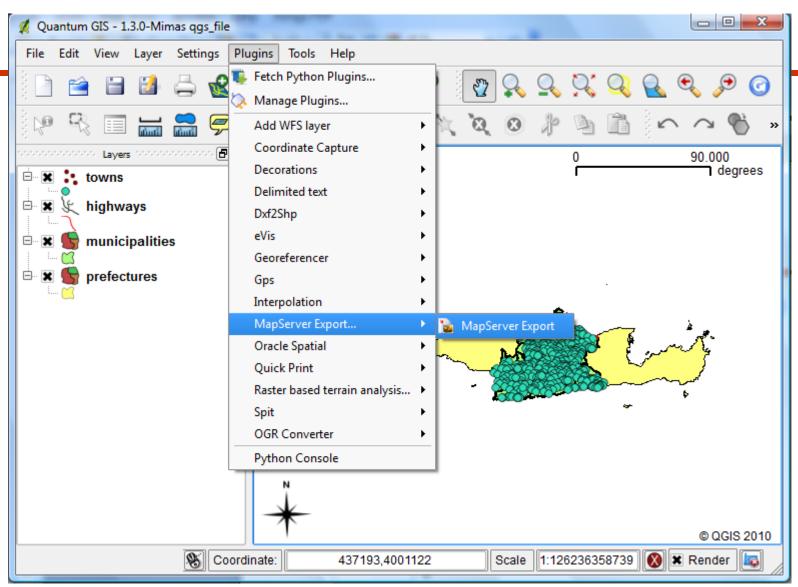

- What we need...
  - To implement WMS and WFS
  - ... are the corresponding **mapfiles**

- The **mapfile** (it's a **text file**)
  - Describes which layers will be served (and how)
    - via WMS or WFS
  - It can be generated
    - manually and/or automatically (e.g., Quantum Plugin)

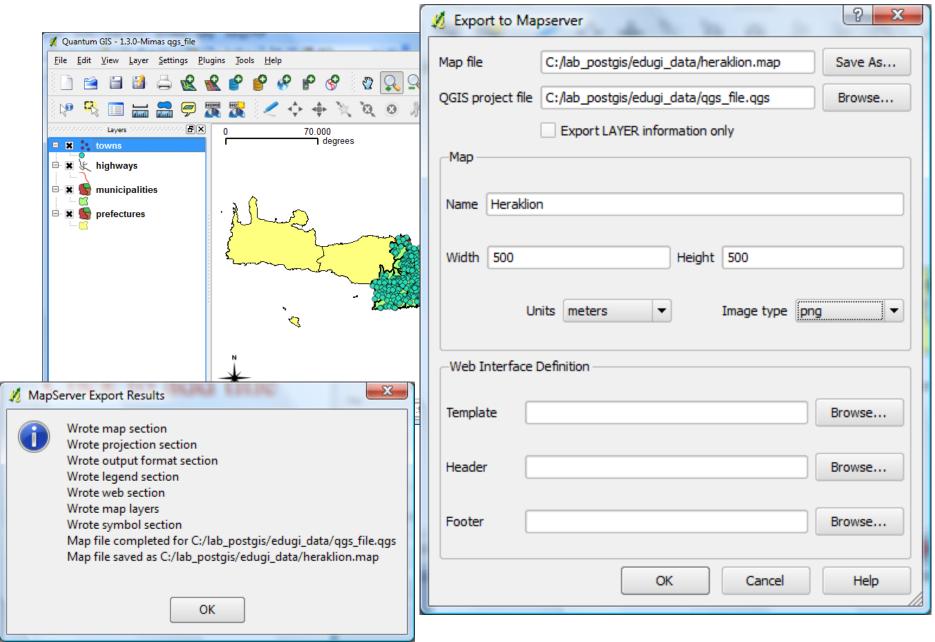

### Web Services with MapServer & Mapfile

#### Generate the Mapfile in Quantum (Plugin)

#### Generate the Mapfile in Quantum (Plugin)

- The mapfile generated...
  - ... may need **manual** processing

- Next ...
  - we will see a **mapfile** (part of)
  - for serving heraklion layers via
    - WMS Service
    - WFS Service
- Available at ...

(needs a VPN connection)
